

Partner App API — Data Requirements

What the CRM needs from the mobile-app backend

Version 1.0 · 17 July 2026 · For: Backend team (Django)

1. Overview

Qonshu CRM shows an **Analytics** view for every partner company that uses the mobile app. To populate it, the CRM sends a **partner** and a **date range**, and expects that partner's numbers for that range in return.

Read-only. The CRM never writes to your system. One endpoint is enough.

2. Request

```
GET /api/qonshu/partner-stats?partner=Acme+Towers&date_from=2026-07-01&date_to=2026-07-31
```

Parameter	Example	Notes
partner	Acme Towers	The partner company. If you have a stable partner id , we'd rather send that than the name.
date_from	2026-07-01	Start of the range (inclusive).
date_to	2026-07-31	End of the range (inclusive).

3. Response

A. Users

Field	Type	Meaning
total_users	number	All app users of this partner.
active_users	number	Users currently active in your system.
engaged_users	number	Users who made at least one payment within the date range.
total_debt	number	Total amount currently owed by this partner's users.

B. Installations

Field	Type	Meaning
<code>total_installations</code>	number	How many users installed the app.
<code>ios_installations</code>	number	Installed on iOS.
<code>android_installations</code>	number	Installed on Android.
<code>logged_in_users</code>	number	Installed and logged in at least once — this is how we measure real usage, not just downloads.

C. Payments in the date range

Field	Type	Meaning
<code>total_payments_count</code>	number	How many payments were made.
<code>total_payments_amount</code>	number	Total money paid.
<code>amount_by_card</code>	number	Of that total — paid by card.
<code>amount_by_manual</code>	number	Of that total — recorded manually.
<code>amount_by_cash</code>	number	Of that total — paid in cash.
<code>utility_payments_count</code>	number	How many utility payments.
<code>utility_payments_amount</code>	number	Total utility amount.
<code>apartment_payments_amount</code>	number	Total for apartments.
<code>parking_payments_amount</code>	number	Total for parking.
<code>non_residential_payments_amount</code>	number	Total for non-residential units.

The three **method** amounts (card + manual + cash) should add up to `total_payments_amount`. The four **category** amounts (utility + apartment + parking + non-residential) should also add up to it.

D. Payments list

The individual payments in the range, so the CRM can show a transactions table.

Field	Type	Meaning
id	string	Your id for the payment.
user_id	string	Who paid.
user_name	string	Their name (or a label, if names can't be shared).
date	datetime	When the payment happened.
amount	number	How much.
method	enum	CARD · MANUAL · CASH
category	enum	APARTMENT · PARKING · NON_RESIDENTIAL · UTILITY

4. Example

```
{
  "partner": "Acme Towers",
  "date_from": "2026-07-01",
  "date_to": "2026-07-31",

  "total_users": 1342,
  "active_users": 1180,
  "engaged_users": 640,
  "total_debt": 18420.75,

  "total_installations": 1200,
  "ios_installations": 520,
  "android_installations": 680,
  "logged_in_users": 900,

  "total_payments_count": 3120,
  "total_payments_amount": 154300.50,
  "amount_by_card": 120400.00,
  "amount_by_manual": 21900.50,
  "amount_by_cash": 12000.00,

  "utility_payments_count": 810,
  "utility_payments_amount": 39200.00,
  "apartment_payments_amount": 82100.50,
  "parking_payments_amount": 21000.00,
  "non_residential_payments_amount": 12000.00,

  "payments": [
    {
      "id": "pay_558210",
      "user_id": "usr_10293",
      "user_name": "Aysel Mammadova",
      "date": "2026-07-14T09:21:00Z",
      "amount": 149.90,
      "method": "CARD",
      "category": "UTILITY"
    }
  ]
}
```

5. Format notes

Topic	Rule
Dates	ISO format — <code>2026-07-01</code> for the range, <code>2026-07-14T09:21:00Z</code> for timestamps.
Money	Number with 2 decimals — <code>149.90</code> .
No data	Return the same structure with <code>0</code> s and an empty <code>payments</code> list — not an error.
Long lists	If <code>payments</code> is very long, paginate it — but keep the totals complete for the whole range.

6. Please confirm

1. Do the **method** values (card / manual / cash) and **category** values (apartment / parking / non-residential / utility) match your system? If you have more, please send the full list.
 2. Can you provide **logged_in_users** — users who installed *and* logged in? This is our key usage metric.
 3. How do you handle **refunds / cancelled payments** — excluded, or sent as negative amounts?
 4. Is there a **partner id** we should send instead of the company name?
 5. Can you also expose a **list of partners** (id + name), so we can match them to our records automatically?
-
